

EDIBLE MUSHROOMS

BY DESIREE WOOD

STA4102 Final Project

A background image showing several mushrooms growing in a forest. The mushrooms are light-colored with gills, and the forest floor is covered with dry leaves and twigs. The image is slightly faded to allow the text to be visible.

The Defining Questions

- Are there features that identify edible mushrooms?
 - The common answer is no, but edible mushrooms still want to be found.
- What habitats are good for finding edible mushrooms?
 - Are there shared features amongst these habitats for edible mushrooms?

About the Data

- UCI Mushroom Data Set - drawn from The Audubon Society Field Guide to North American Mushrooms (1981). G. H. Lincoff (Pres.), New York: Alfred A. Knopf
- Categorical data with 8124 observations containing 22 different attributes of mushrooms.
- Contains data for 23 different species of gilled mushrooms apart of the Agaricus and Lepiota Family.

Agaricus campestris

Mushroom Features

diagrams are modified from Lincoff, G. H. 1981 National Audubon Society Field Guide to North American Mushrooms. Alfred A. Knopf, New York.
<https://www.usask.ca/biology/fungi/glossary.html>

- ☐ Cap Shape
- ☐ Stalk Root
- ☐ Cap Surface
- ☐ Gill Attachment
- ☐ Ring Type
- ☐ Gill Spacing
- ☐ Cap Color
- ☐ Bruises
- ☐ Odor
- ☐ Gill Size
- ☐ Gill Color
- ☐ Stalk Shape
- ☐ Stalk Surface
- ☐ Stalk Color
- ☐ Veil Type
- ☐ Veil Color
- ☐ Ring Number
- ☐ Spore Color
- ☐ Population
- ☐ Habitat

Methods for Analysis

- Check for missing data – only one variable has missing data
 - Dropped Stalk Root variable from analysis
- Find dependent Variables with Proc Freq and Cramer's $V > .5$
 - Odor, Spore Print Color, Gill Color and ring type all above .6
 - Stalk Surface, Gill Size, Stalk Color, Bruises all above .5

Edible Frequency by Habitat

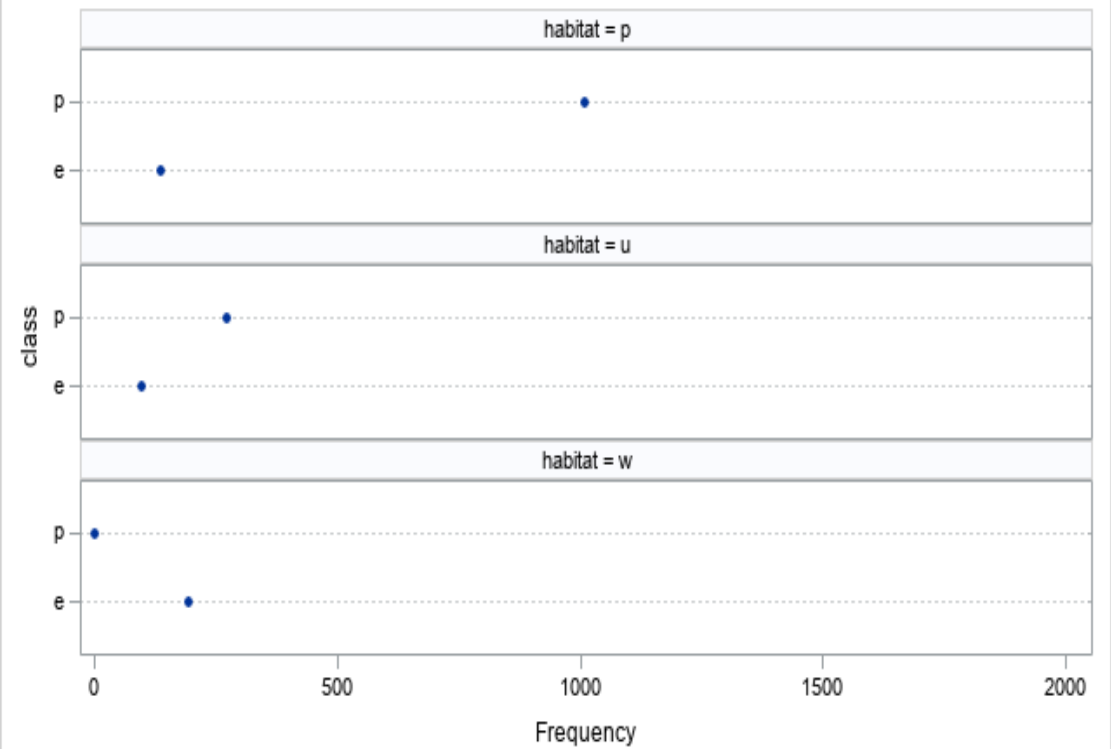

Frequency Percent Row Pct Col Pct	Table of class by habitat								
	class	habitat							Total
		d	g	l	m	p	u	w	
	e	1880	1408	240	256	136	96	192	4208
		23.14	17.33	2.95	3.15	1.67	1.18	2.36	51.80
		44.68	33.46	5.70	6.08	3.23	2.28	4.56	
		59.72	65.55	28.85	87.67	11.89	26.09	100.00

ODOR & GILL
COLOR EDIBLE
TRAITS

- Edible Learning:
- Almond
- Anise
- None

- Edible leaning:
- Red
- Black
- Brown
- Orange
- Purple
- White
- Yellow

HABITATS AND EDIBLE TRAITS

**Distribution of gill_color by class
Controlling for habitat=m**

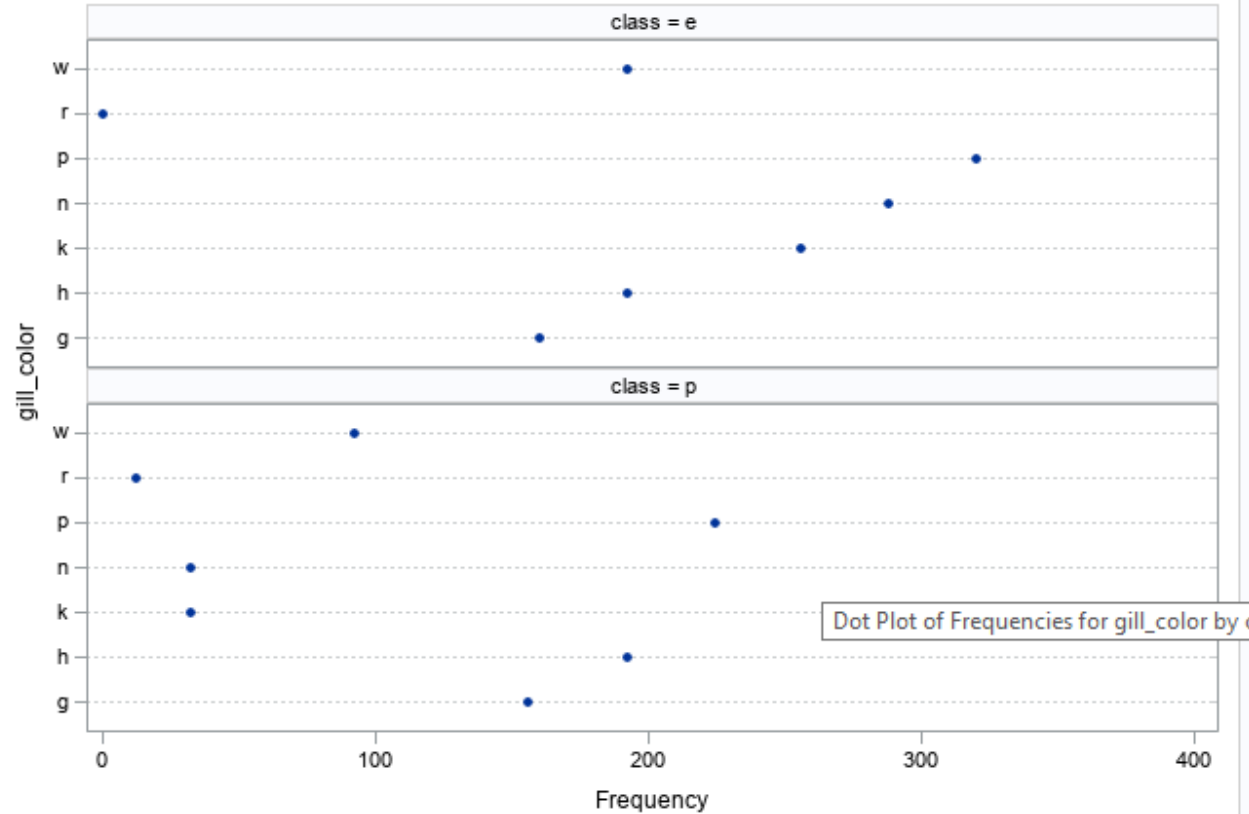

- In meadows mushrooms with the gill colors white, brown, black, and grey tend to be more likely edible
- Their smells will likely be anise or almond

Meadows

**Distribution of odor by class
Controlling for habitat=m**

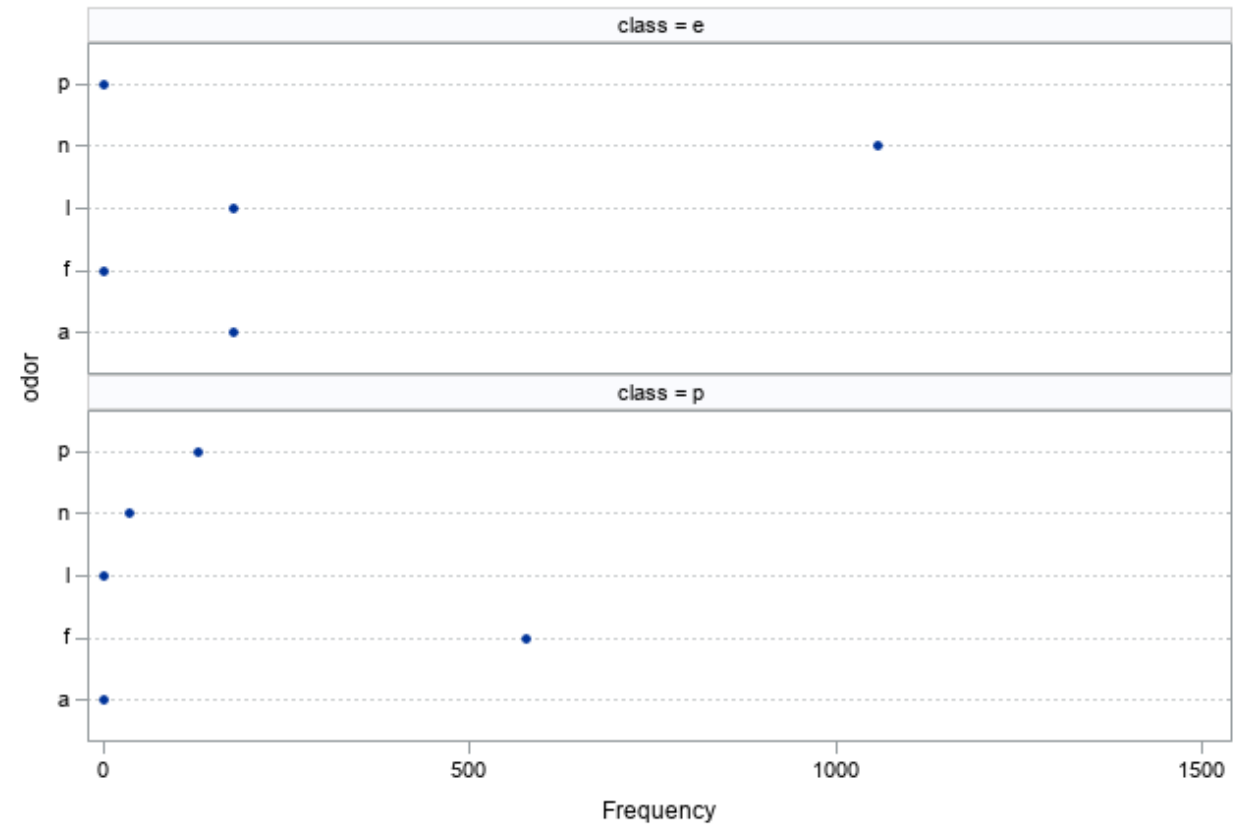

Distribution of gill_color by class
Controlling for habitat=g

- In grasses mushrooms with the gill colors brown and black, tend to be more likely edible
- Likely to have no smell

Grasses

Distribution of odor by class
Controlling for habitat=g

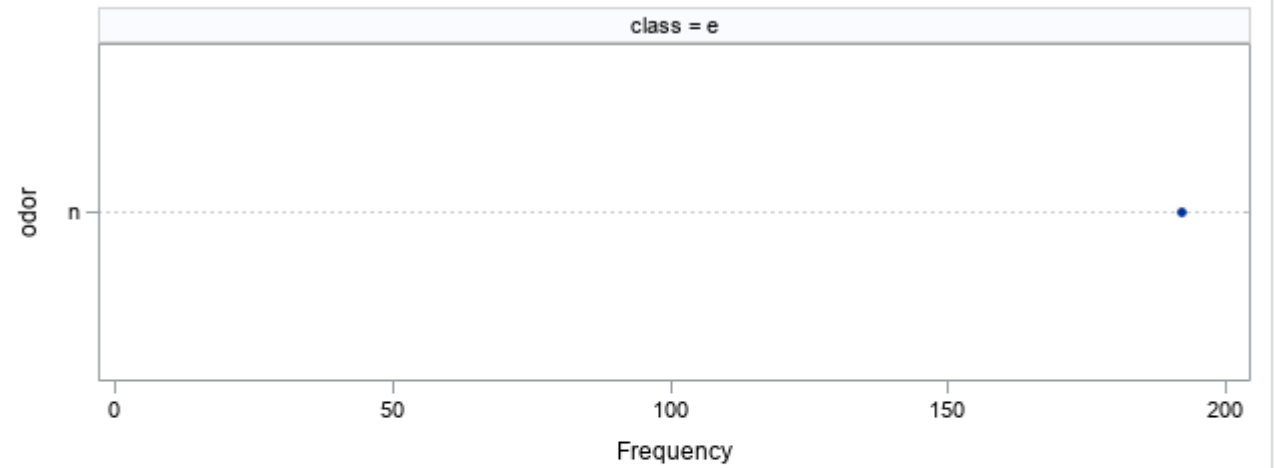

Distribution of gill_color by class
Controlling for habitat=w

Waste

Distribution of odor by class
Controlling for habitat=w

Dot Plot of Frequencies for odor by class

- Mushrooms in waste are should always be edible

Conclusion

While some taints show a dependance on being edible or not. There is no defining broad answer

A few areas are more likes meadows, grasses and waste are more likely to edible mushrooms than other habitats

There are some common features that indicate a mushrooms is edible

Always verify the mushroom's species before consuming
